

FRESHPLUG ORGANICS

Mobile App — Phase 1 Scope

A concrete, buildable slice of the shop experience for iOS & Android

Draft for discussion · August 2026

Phase 1 is deliberately narrow: browse the catalog, build a cart, and check out via WhatsApp — the exact flow that already works on the web app today. Nothing here requires new backend work; it reuses the existing Supabase project and content. Accounts, push notifications, and real in-app payments are explicitly deferred so the first release ships fast and gets real customer use before more is built on top of it.

In scope vs. deferred

Area	Phase 1	Notes
Browse products (Shop)	IN	Category filters, search, sort — reads from the same products table via <code>@/lib/data/products.ts</code> .
Product detail / options	IN	Weight/size variants, per-tier pricing (already modeled server-side).
Cart	IN	Same shape as <code>useCart()</code> , ported to <code>AsyncStorage</code> .
WhatsApp checkout	IN	<code>wa.me</code> deep link via React Native Linking — no new integration.
About / Process / FAQ / Gallery (read-only)	IN	Static-ish content pages, same Supabase-backed data.
Contact form	IN	Writes to <code>contact_messages</code> — public-insert RLS policy already exists.
Sign-in / customer accounts	OUT	Phase 2. Order history isn't needed for a WhatsApp-checkout flow yet.
Push notifications	OUT	Phase 2+, only once there's an order-status event to notify about.
In-app / M-Pesa payment	OUT	Requires a real payment integration decision — separate scoping conversation.
AI chat widget	OUT	Nice-to-have; not core to "browse and order." Revisit once core flow is validated.
Admin app	OUT	Admin stays web-only (<code>/admin</code>); no reason to duplicate it into a customer-facing app.

Technical approach

Framework	Backend
-----------	---------

Expo (managed) + TypeScript. Lets you build iOS binaries via EAS Build without owning a Mac, and keeps the language/tooling identical to web/.

Same Supabase project. No schema changes for Phase 1 — products, faqs, gallery_photos, contact_messages, orders are already public-read (or public-insert) under existing RLS.

Code sharing

Extract Product/CartItem types and the Supabase client factory into a shared package rather than a third re-implementation — web/AGENTS.md already flags this pattern as a past mistake worth not repeating.

Cart storage

useCart()'s logic ports as-is; only the storage call changes from localStorage to AsyncStorage (same JSON shape, same freshplug_cart-style key).

Milestones

- 1 **Project setup.** Expo app scaffolded, EAS account connected, shared Supabase client + env config wired, brand theme (clay/gold palette, fonts) ported from legacy.css tokens.
- 2 **Shop & product detail.** Category/search/sort list view, product detail screen with variant options and per-tier pricing.
- 3 **Cart & WhatsApp checkout.** Add/remove/update quantity, persisted locally; checkout composes the same order-summary message and opens WhatsApp.
- 4 **Content pages.** About, Process, FAQ, Gallery, Contact — read-only screens against existing Supabase tables.
- 5 **Store readiness.** App icons/splash, privacy policy URL, TestFlight + Play internal testing track, submission to both stores.

Prerequisites checklist

- Apple Developer Program enrollment (\$99/yr) — required before TestFlight or App Store submission.
- Google Play Console account (\$25 one-time).
- Expo/EAS account for cloud builds.
- App icon, splash screen, and store screenshots (can adapt existing brand assets).
- Privacy policy hosted at a public URL — privacy-policy.html/web/src/app/(legal)/privacy-policy content can be reused, but both stores require it linked from the app listing.
- Decision: publish under the existing Freshplug Organics developer identity, or a new one.

Explicit non-goals for Phase 1

No customer accounts, no push notifications, no in-app payment, no admin functionality, no AI chat. Each is a reasonable Phase 2+ candidate once the core browse-and-order flow is live and used — but bundling them into v1 risks a slower first release without validating that customers actually want a native app over the existing mobile web experience.
